“Scrambled!” Answer Key

1. tobacco
2. harmful
3. nicotine
4. brain
5. smoke
6. lungs
7. addicted
8. quit

Unsafe No Matter What You Call Them

Whether you call them *vapes*, *e-cigs*, *mods*, or *e-hookahs*, electronic cigarettes all have one thing in common: They can be unsafe, particularly for young people. Why? There are several reasons. Most e-cigarettes contain nicotine, a highly addictive drug that is found in tobacco products like regular cigarettes. Nicotine can negatively affect critical parts of the brain, an organ that is still developing in adolescents. This can create long-lasting problems such as permanently lowering impulse control and harming the parts of the brain that control moods, learning, and attention. The aerosol produced by e-cigarettes also contains ingredients that can be harmful to the lungs. In addition, research has shown that a person who starts smoking e-cigarettes in middle school or high school is more likely to smoke other tobacco products like regular cigarettes and smokeless tobacco. E-cigarettes may seem cool and convenient, but they are not the safe product advertisers want you to believe they are.
